paulbrowne@users.sourceforge.net

# What is JUnit?

NoUnit

- Makes it easier to write & run unit tests
- Like scaffolding on building
- Written by Erich Gamma and Kent Beck
- Extensions , for languages (.Net , Python etc) and different situations (Cactus , test within web server)
- more info at [www.junit.org](http://www.junit.org)

# What's the Problem?

NoUnit

- How Extreme do you want to go?
- Do you need to test everything
- Does the entire team buy in?
- You're meant to write you tests first ...
- **Problem: How do you see what is being tested and what is not?**

# NoUnit is the Answer

NoUnit

- **NoUnit shows you what is being tested and what is not.**
  - Makes nice pictures (green is good , red is bad!)
  - Complementary tool , not extension or replacement (as Cactus / .Netunit)
  - Released under GPL
  - Easy to use , integrates with Ant
  - Extensible
